

**AMENDMENTS TO THE SPECIFICATION**

**Please delete the paragraph bridging pages 30 and 31 and replace it as follows:**

In order to send the message ID of a new message according to the present invention in the previous VMN service, the first embodiment can be implemented utilizing the CHARi field 630 as shown in FIG. 6D. When a plurality of newly-arrived voice messages exist and a method in which a short message indicating the ~~indicating the~~ arrival of each new voice message is sequentially transmitted, only one voice mail ID field 633D is required. However, when the arrival of all new voice messages stored in the voice mailbox of a voice mail server are indicated through one short message, a plurality of voice mail ID fields 633D are required and optionally a number field 632D for showing the number of voice mail IDs. In the meantime, since the number field 632D in the CHARi field 630 performs a function similar to the message number field 614 of FIG. 6B, the message number field 614 of FIG. 6B can be used without a separate number field 632D in the CHARi field 630. In addition, in order to maintain coherence to the short message format used in FIGS. 6E and 6F, op\_codes for indicating the arrival of new messages can be included, which is not shown in FIG. 6D.
